

A brief plan on how I would do it, I would have done is:

- On the homepage where the 5 articles are present once the 5 articles had been read. A 6th button would appear which would say "Article Ranker".
- This would be done by creating an Array which would store each page which was visited so that once all 5 had been visited and stored in the array it will display the new button.
- When the user clicks this they will be taken to another javascript which would form a page with 5 slots where the user could input there rank out of 10.
- In terms of coding I would use the POST method which would send a command to a php file once the user enters there 5 ranks as this data is sent to the php file. This will allow for a new JSON file to be created which would look something like this below.

```
{  
    "Article_1": "input_1",  
    "Article_2": "input_2",  
    "Article_3": "input_3",  
    "Article_4": "input_4",  
    "Article_5": "input_5"  
}
```

This is what I would have done understanding to the best of my knowledge what you wanted me to create.
